Good performance at an affordable price

All seeds need sufficient care and attention. Incotec's new Disco AG Red L-144 delivers an attractive appearance and proper adhesion of any plant protection product (PPP) you apply to your open pollinated (OP) crop seeds. This means that the PPPs are active where they are supposed to be - on the seed – providing increased safety for the environment and for people working with the seeds.

Because we understand that OP crops need an effective product at a reasonable price, we developed a tailor-made film coating that delivers more than just adequate performance. The Disco AG Red L-144 performs well above average and is available at an affordable price. Disco AG Red L-144 for OP crops is available in India and South-East Asia.

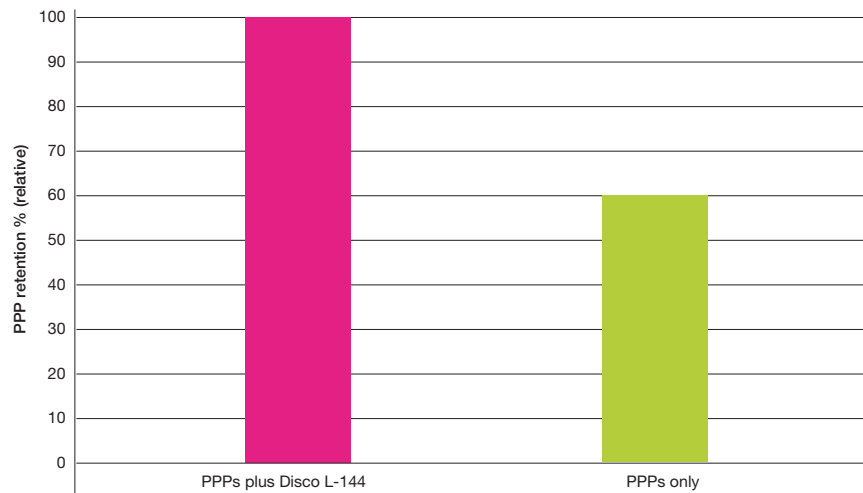

Effective retention of active ingredients

When seeds are treated with PPPs, keeping the active ingredient on the seed is important. This will increase safety for workers in the facility where the seed is treated and for farmers sowing the seeds. It also reduces the impact on the environment where PPP release could have a negative effect on pollinators (insects) or could induce resistance.

Seeds treated with PPPs plus Disco AG Red L-144 showed an improved retention of the active ingredient on the seed when compared with seeds treated only with PPPs. This means that the addition of this product to your PPP package will increase the effectivity of your PPP treatment.

Disco AG Red L-144 is designed for use on a wide variety of open pollinated crops. Sample collections of various seeds treated with various amounts of film coat are available on request from your Incotec representative.

(relative) Amount of PPP retained on seed as measured by HPLC
